LEARNING DIARY, NODEJS MODULE

LEARNING DIARY

STYLE 3

17.5.2020

In this module, I learned about creating a simple nodejs server with javascript. I learned to find and kill the process for node server. Here is how to find the process, `lsof -i tcp:3000`. This is how to kill the process, `kill -9 3000`. This was needed as I wanted to test multiple server.js files. After this, I went to read the nodejs documentation. I found another way to kill the server, `process.exit()` or control c. It is recommended not to use the `process.exit()` on the documentation as it aborts any running request.
