### **STYLE 3**

15.5.2020

My environment has GIT, VS Code and NodeJS previously installed on it. Following the video about facebook, I tried unsuccessfully to access graph.facebook.com/youtube because it required an access\_token. The api in the video <http://maps.googleapis.com/maps/api/geocode/json> also did not work. After unsuccessfully trying to access these application programming interfaces: google map and facebook; I looked and searched for other open source apis without the OAuth access\_token. I found it on github at <https://github.com/public-apis/public-apis#animals>. For example in the cat fact documentation, retrieving facts about cats require the user to type the following endpoint <https://cat-fact.herokuapp.com/facts>. This endpoint requested a GET request with the JSON file of cat facts. This can be queried by the following objects: all, \_id, text, type, user and many more. I created a simple html and javascript file that does a fetch request to the link. I made a get request on the object data just getting the texts and made a read only on the html file. This can be downloaded and installed on your local repository.
