LEARNING DIARY, MongoDB MODULE

## **LEARNING DIARY**

### **STYLE 3**

26.5.2020

In this module, I learned about mongodb crud functions such as: querying data, making a collection, deleting data and updating data. For example, mongodb querying syntax is `db.collections('collection_name').find()`. In addition, I learned how to download mongodb for a macOS, use compass with local server, create and login to MongoDB atlas. For the code along material, I created a mongodb readme file. For additional learning and querying, I created a material.js file. Furthermore, I installed mongoose and tested the connection to the local server in app.js. I also created an MongoDB Atlas account to be used with mongoose for the project.
